

Supplementary Table 5. In silico pathogenicity prediction scores and classifications for CYP21A2 variants across fourteen computational tools.

This table summarizes the numerical scores and categorical pathogenicity classifications generated by fourteen commonly used in silico prediction tools for all CYP21A2 missense variants analyzed in this study. Each tool provides a quantitative score (upper row) and a corresponding predicted functional impact or pathogenicity category (lower row) for each variant. Higher scores generally reflect stronger predicted functional impact for Alpha Missense, PolyPhen-2, CADD, MutPred2, DANN, FATHMM, Meta-SNP, SNAP, PhD-SNP, PANTHER, SNPs&GO and S3Ds&GO, whereas lower scores indicate stronger predicted deleteriousness for SIFT and PredictSNP2. Classification labels follow the terminology used by each tool (e.g., “Likely benign”, “Benign”, “Possibly damaging”, “Deleterious”, “Neutral”). A dash (–) indicates that a classification is not provided by the respective tool.

These data correspond to the values visualized in Figure 6 (Heatmap of In Silico Pathogenicity Predictions for Ten CYP21A2 Missense Variants).

Variant		R76K	E162G	S274Y	L308V	S373N	P387L	H393Q	R401G	R436C	S494N	L10del
